

### **Amendments to the Claims**

The listing of the claims will replace all prior versions and listings of claims in the application.

1. (Currently amended) A component mounting system for mounting a component within a casing, including a component support securable to a said casing; at least one post ~~coupled to the component support and~~ fixedly attached to at least one spring member associated with said component support, said at least one post being operable to be engaged in at least one associated recess in the component, the at least one post being movable between a component engaging position and a component non-engaging position; and a post moving device operable to engage and disengage a raised dome portion of said at least one spring member to thereby move and retain the at least one post in a selected one of said component engaging position and said component non-engaging position.

2. (Currently amended) A system according to claim 1, wherein the ~~at least one post is mounted on at least one sprung support~~ at least one spring member has:

- (a) a mounting section provided with mounting holes for facilitating securement of the mounting section to said casing;
- (b) a resilient central section including said raised dome portion; and
- (c) at least one end portion for supporting said at least one post.

3. (Currently amended) A system according to claim 2, wherein the ~~at least one sprung support~~ spring member biases the at least one post towards the component engaging position.

4. (Previously presented) A system according to claim 1, wherein the post moving device is slidable between two positions so as to remove and retain the at least one post in either said component engaging position or said component non-engaging position.

5. (Previously presented) A system according to claim 1, wherein the system

provides for grounding of a component through at least one of the at least one spring member, the component support and the at least one post.

6. (Previously presented) A system according to claim 1, wherein the casing is in the form of a chassis.

7. (Currently amended) A computer including a casing and a component mounting system for mounting a component within the casing, the component mounting system including at least one spring member ~~a component support~~ secured to the casing; at least one post ~~coupled to the component support~~ fixedly attached to said at least one spring member and being operable to be engaged in at least one associated recess in the component, the at least one post being movable between a component engaging position and a component non-engaging position; and a post moving device operable to engage and disengage a raised dome portion of said at least one spring member to thereby move and retain the at least one post in a selected one of said component engaging position and said component non-engaging position.

8. (Currently amended) A computer according to claim 7, wherein the ~~at least one post is mounted on at least one sprung support~~ at least one spring member has:

(a) a mounting section provided with mounting holes for facilitating securement of the mounting section to said casing;

(b) a resilient central section including said raised dome portion which engages with said post moving device to cause said at least one post to move into said component engaging position as said resilient central section deflects; and

(c) at least one end portion for supporting said at least one post.

9. (Currently amended) A computer according to claim 8, wherein the ~~at least one sprung support~~ spring member biases the at least one post towards the component engaging position.

10. (Previously presented) A computer according to claim 7, wherein the post

moving device is slidable between two positions so as to remove and retain the at least one pos in either said component engaging position or said component non-engaging position.

11. (Previously presented)        A computer according to claim 7, wherein the system provides for grounding of a component through at least one of the component support and the at least one pos.

12. (Previously presented)        A computer according to claim 7, wherein the casing is in the form of a chassis.

13. (Previously presented)        A computer according to claim 7, wherein the computer is a personal computer.
